Lightning-Smart
PHP IDE

PS

PhpStorm

Enjoy Productive
PHP Development

Key features

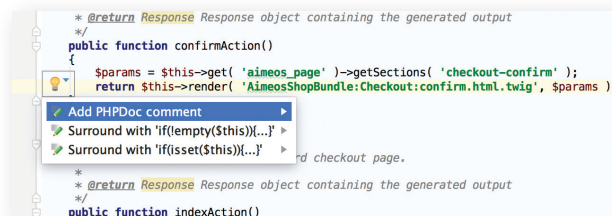

Smart PHP code editor

PhpStorm features an editor that actually “gets” your PHP code and deeply understands its structure. The IDE provides the best code autocompletion, refactorings, on-the-fly error prevention, supports language mixtures and more. Automated refactorings treat your code with care, helping you make global project changes easily and safely.

Code quality analysis

Hundreds of code inspections verify your code as you type, inspecting the whole project for possible errors or code smells. PHPDoc support, code (re)arranger, code formatter with code style configuration and other features help you write neat code that's easy to support.

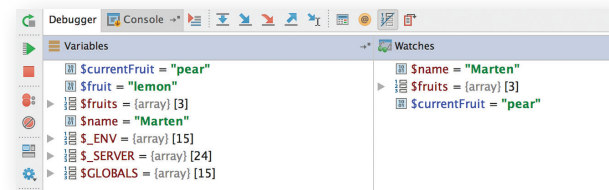

REST API development

The editor-based REST client will assist you in composing HTTP requests, sending them to web-services, viewing responses, and analyzing them.

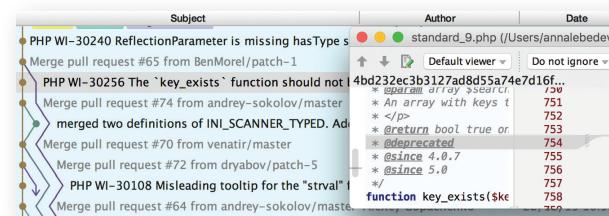

Debugging, testing and profiling

PhpStorm is renowned for its zero-configuration Visual Debugger, providing extraordinary insight into what goes on in your application at every step. It works with Xdebug and Zend Debugger, and can be used both locally and remotely. Testing with PHPUnit, Behat, PHPSpec, and Codeception as well as profiler integration are also available.

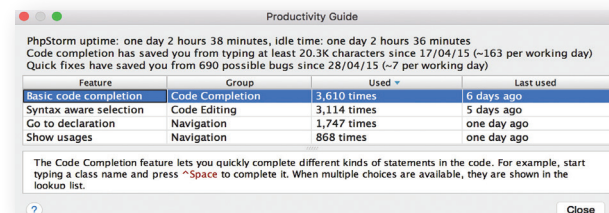

Complete development environment

Perform many routine tasks right from the IDE, thanks to Version Control Systems integration, support for remote deployment, databases/SQL, command-line tools, Vagrant, Composer, REST Client, and many other tools.
